Signalpost

A registry-anchored agent for verified Norwegian company facts

Builderr challenge submission

Harsh Dhavane

Executive summary

- **Problem:** Given only an org. number, return facts, sources and dates for 100 random Norwegian companies a day. One wrong-company fact or invented financial value disqualifies the entry.
- **Approach:** Anchor on Brønnøysund registry exact-key APIs, publish web facts only behind an identity gate, and use no language model.
- **Results:** 100 of 100 valid profiles in 4.1 minutes, on 899 of 2,000 requests, at $0. Hand audits found 0 wrong-company publications.
- **Gaps:** Websites (17% of companies) and job postings (0%) are the weakest families, partly because few small companies have either.
- **Next:** Add sector registers that are keyed by org. number, and new website proof types, each hand-audited.

A website is published only when one of four identity rules proves it belongs to the company

Registry anchor → Official facts by exact key → **Identity gate** → Web facts and jobs → Refresh and cited brief

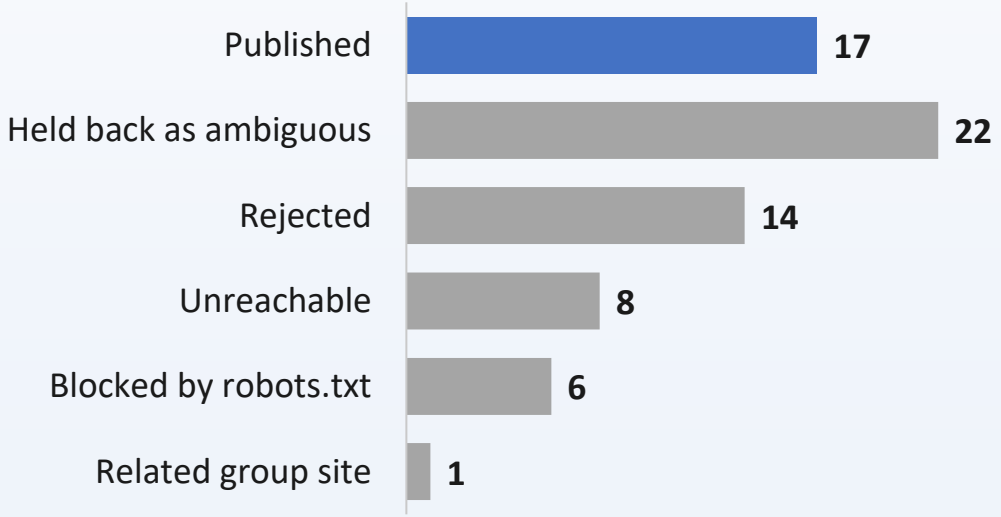

A site needs at least one of these proofs

1. The company's exact org. number is printed on the site
2. The registry e-mail domain is the site's domain, and the legal name appears in its identity fields
3. The legal name, plus the registry phone or street address, appears on the site
4. The registry or Wikidata declares the site, and its identity fields carry the legal name

Parked pages, unproven redirects and sites showing another company's number are held back.

Website candidates by gate outcome

Count of candidates, 100 random companies

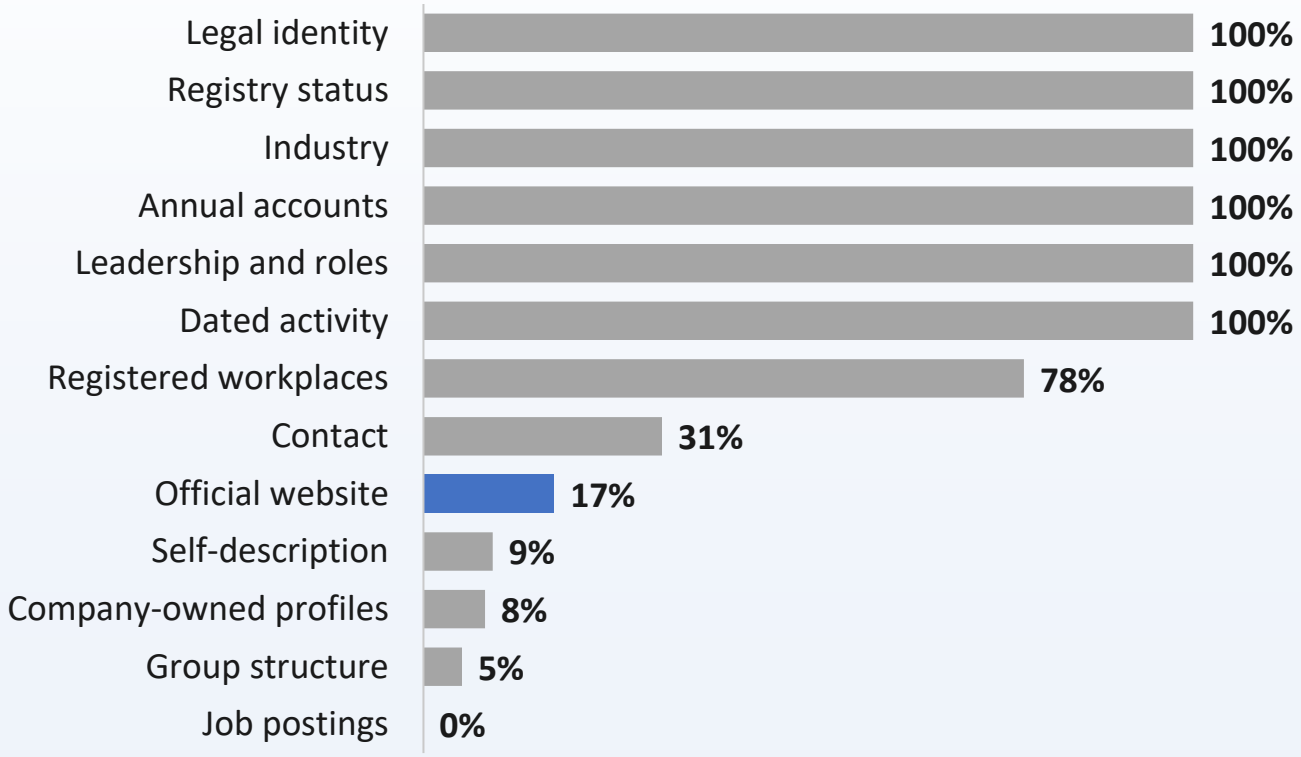

Source: Signalpost benchmark reports (reports/ folder), 100-company random run

Registry facts reach every company; web-based facts reach fewer than one in five

Share of companies with published facts, by field family

%, 100 random companies

6 of 13 families at 100%

Identity, status, industry, accounts, roles and activity come from exact-key registry lookups, so there is no identity risk.

17% published, 33% held back

For a third of companies a candidate site was found but identity could not be proven, so nothing was published.

Sparse by nature

About 85% of companies have no employees and only 11% list a website.

Source: Signalpost benchmark reports (reports/ folder), 100-company random run. Group structure: 95% of companies are not in a group.

The daily test ran well inside its limits, with 0 wrong-company publications and $0 cost

100/100
valid profiles, 100 random companies

4.1 min
of the 45-minute daily limit

899
of 2,000 allowed requests

$0
external API cost; no paid APIs or LLM

Precision and refresh checks

- **0** wrong-company publications in hand audits of every published website
- **100%** of facts carry source URL, retrieval time, SHA-256 hash and source text
- **30 of 30** re-fetched sources still contained the cited text
- **0** false changes on an identical re-run; 6 of 6 injected changes detected

Limitations

- Websites and job postings are the weakest families
- At 1,000 companies the request cap leaves most without web facts

Next steps

- Add sector registers keyed by org. number
- Add website proof types, each hand-audited
- Read careers pages linked from verified sites
